The Stomach

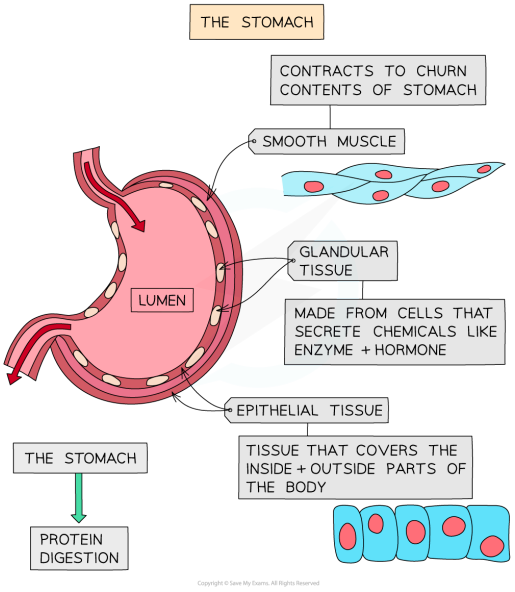
- The stomach is one of a number of organs that make up the digestive system
- The role of the digestive system is to break down large insoluble molecules into smaller, soluble food molecules to provide the body with nutrients
- The stomach lining contains **muscles** which contract to **physically squeeze** and mix the food with the strong digestive juices that are present
  - Also known as "stomach **churning**"
- Food is digested within the stomach for several hours



Three types of tissue found in the stomach are muscular, epithelial and glandular. These tissues work together to allow the stomach to carry out its role.
