Plastic Pollution

- Plastics have a large negative impact on both land and water habitats due to their non-biodegradability
- In marine habitats:
  - Animals often try to **eat plastic** or **become caught in it**, leading to injuries and death
  - As the plastic breaks down it can **release toxins** that affect marine organisms
  - Once it has broken down into **very small particles**, it is commonly ingested by animals and **enters the food chain**

  On land:
  - Plastic is generally disposed of by **burying in landfills**
  - As it breaks down, it releases **toxins** into the surrounding soil and as such the **land is no good for growing crops or grazing animals** and can only be used for building on several decades after burial

Air Pollution

Methane and Carbon Dioxide

- Both gases insulate the Earth and act as a 'blanket' around the atmosphere

atmosphere
- Burning fossil fuels increases carbon dioxide
- Keeping livestock generates methane gas
- Global warming melts the permafrost in sub-polar regions, which results in even more trapped methane being released into the atmosphere
