Help me understand

Importance of Active Transport: Extended

- Energy is needed because particles are being moved **against a concentration gradient**, in the opposite direction from which they would naturally move (by diffusion)
- Active transport is vital process for the movement of molecules or ions across membranes
- Including:
  - **uptake of glucose** by epithelial cells in the villi of the small intestine and by kidney tubules in the nephron
  - **uptake of ions** from soil water by root hair cells in plants

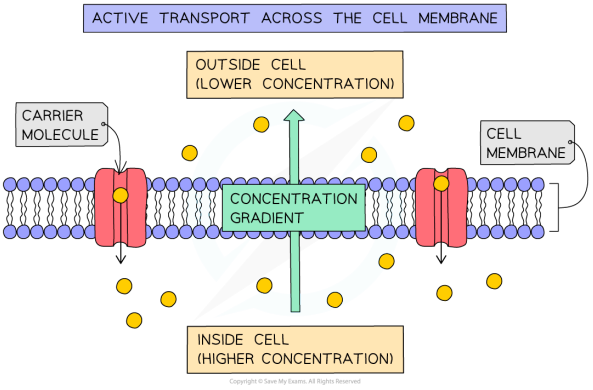
Protein Carriers: Extended

- Active transport works by using **carrier proteins** embedded in the cell membrane to pick up specific molecules and take them through the cell membrane against their concentration gradient:

1. Substance combines with carrier protein molecule in the cell membrane

Stuck on something?
Ask questions and get help with exactly what you're revising.
Got it

through the cell membrane
3. Substance released into cell



Carrier proteins in active transport

Examiner Tips and Tricks

You don't need to know anything about the phospholipid bilayer when it comes to active transport!
