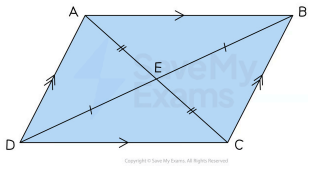
Properties of lines & angles

What properties do I need to know about lines?

- A **line** is a straight, one dimensional path that extends forever
  - A **line segment** is a part of a line, it has a start and an end point
  - A line segment that starts at the point *A* and ends at the point *B* is usually labelled *AB*
  - Two lines with single marks are of equal length
    - Two other lines with double marks are of (a different) equal length
- Two lines are **parallel** if they continue in the **same direction as each other** forever
  - Parallel lines never **intersect** (meet)
  - Parallel lines should be marked with arrows
    - If there is more than one pair (or set) of parallel lines in a diagram then multiple arrows will be used



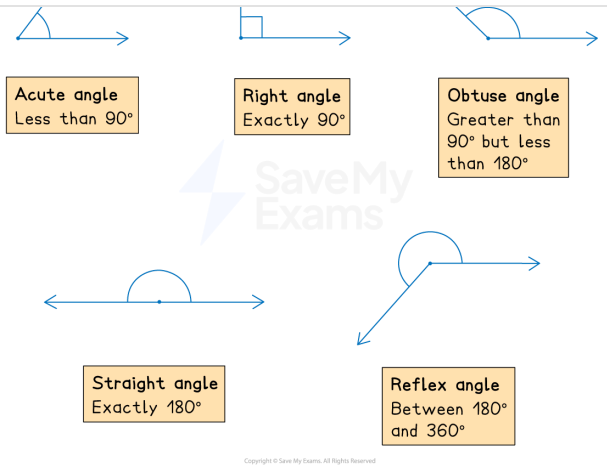
- Two lines are **perpendicular** if they intersect at right-angles (90°)

What properties do I need to know about angles?

- When two lines **intersect** (meet) they will form an angle
- There are different **types of angles**
  - An angle that is less than 90° is called an **acute angle**
  - An angle that is exactly 90° is called a **right angle**
  - An angle that is greater than 90° and less than 180° is called an **obtuse angle**
  - An angle that is exactly 180° is called a **straight angle**
  - An angle that is greater than 180° but less than 360° is called a **reflex angle**

Help me understand

Stuck on something?
Ask questions and get help with exactly what you're revising.
Got it



- Angles at a point add up to 360°
- Angles on a straight line add up to 180°
  - Angles that add up to 180° are called **supplementary angles**
    - e.g. 30 and 150 degrees are supplementary angles

Examiner Tips and Tricks

- Do not assume two lines are parallel or perpendicular just because they look it, always look out for the arrows or right angle in a diagram, or read the question to look for clues

Worked Example

Write down the mathematical name for an angle which is greater than 90° but less than 180°.

Answer:

An obtuse angle
