Midpoint of a line

How do I find the midpoint of a line?

Help me understand

- The **midpoint** of a line will be the **same distance from both endpoints**
- You can think of a midpoint as being the average (**mean**) of two coordinates
- The **midpoint** of (x_1, y_1) and (x_2, y_2) is

$$\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$$

Worked Example

The coordinates of *A* are (–4, 3) and the coordinates of *B* are (8, –12).

Find the coordinates of the midpoint of *AB*.

Answer:

The midpoint can be found using $\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$

Stuck on something?

Ask questions and get help with exactly what you're revising.

Got it

$$\left(\frac{-4+8}{2}, \frac{3+-12}{2}\right) = \left(\frac{4}{2}, \frac{-9}{2}\right)$$

Simplify

(2, −4.5)
