Help me understand

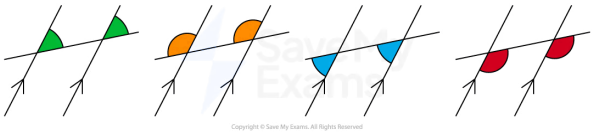
Angles in parallel lines

What are parallel lines?

- Parallel lines are lines that are always **equidistant** (the same distance apart)
  - No matter how far the lines are extended in either direction, they will **never meet**
- **Angles** are formed when a **straight line** cuts through **two parallel lines**

What are corresponding angles in parallel lines?

- Find **corresponding angles** by looking for an **F-shape**
- **Corresponding** angles are **equal**



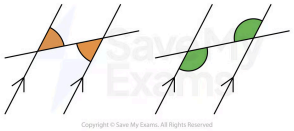
Corresponding angles

Stuck on something?

Ask questions and get help with exactly what you're revising.

Got it

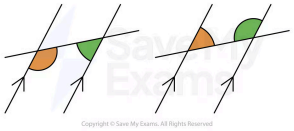
What are alternate angles in parallel lines?



Alternate angles

What are co-interior (supplementary) angles in parallel lines?

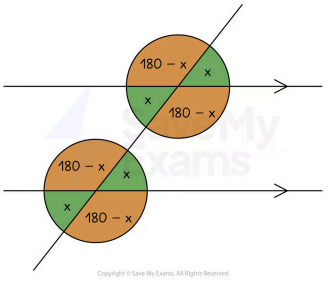
- Find **co-interior angles** by looking for a **C-shape**
- **Co-interior** angles **add** up to **180°**



Co-interior angles

How do I find missing angles in parallel lines?

- Look for shapes that look like **F**, **Z**, or **C**
- **Vertically opposite angles** can also be used in problems involving parallel lines
  - The below diagram shows how identifying angle x, can lead to knowing information about several other angles
    - The green angle opposite is also x, as it is vertically opposite
    - The orange angle must be 180−x as angles on a straight line sum to 180°
- You should also be able to spot **corresponding** angles, **alternate** angles, and **co-interior** angles in this diagram



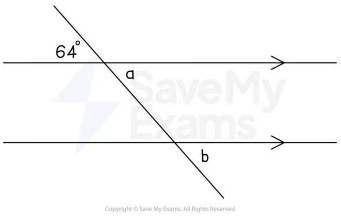
Examiner Tips and Tricks

Do not forget to give **reasons** for each step of your working in an angles question. These are often needed to get **full marks**

Worked Example

Find the size of the angles *a* and *b* in the diagram below.

Give a reason for each step in your working.



Answer:

***a* = 64° (Vertically opposite angles are equal)**
***b* = 64° (Corresponding angles on parallel lines are equal)**
